

šifrování / certifikáty

certificate signing request (CSR)

Podle:

<http://hublog.hubmed.org/archives/001075.html>

<http://www.securityfocus.com/infocus/1820>

1) generate private key and certificate signing request:

```
openssl genrsa -out example.org.key 2048
openssl req -new -key example.org.key -out example.org.csr
```

The keys must not be password protected, otherwise Apache will hang waiting for a password when it starts up.

2) verify .csr:

```
openssl req -in example.org.csr -noout -text
```

3) Verify signed Apache certificate

```
openssl verify -CAfile trusted_ca.crt -purpose sslserver example.org.c
ertserver.crt
```

Unique solution ID: #1193
